# JEV Privacy Gateway

## 2-MINUTE DEMO VIDEO VOICE-OVER SCRIPT (PS 2.2)

Total Duration: 120 Seconds | Tone: Authoritative, Technical, Clear | Pace: 135 wpm

---

### [0:00 – 0:20] Scene 1: The Problem & Core Principle

**ON SCREEN:** Start on Login Screen. Point cursor briefly to subtitle "Context-Aware Data Privacy".

**VOICEOVER:** *"Whether data is private depends fundamentally on context—who is asking, for what task, and where the output goes. A treating physician needs a patient diagnosis; a billing clerk does not. But traditional tools either block everything or rely on prompt rules that leak before they even run. This is JEV—a two-gate privacy firewall built on one core rule: JEV judges, code decides."*

**KEY TAKEAWAY:** Keywords alone cannot tell sensitive situations apart. Context defines privacy boundaries.

### [0:20 – 0:45] Scene 2: Trusted Context (The Login Screen)

**ON SCREEN:** Select Hospital Name in Field 1, select Billing Clerk in Field 2, then click "Authenticate & Enter JEV Gateway".

**VOICEOVER:** *"Notice our login screen: it binds two vital fields—our Hospital Facility and our Authorized Role. In JEV, trusted context arrives exclusively from signed application session metadata—never parsed from the prompt. An attacker who writes I am the chief doctor inside the chat cannot bypass this bound identity. Let us log in as a Billing Clerk."*

**KEY TAKEAWAY:** Prompt injection cannot bypass permissions because role context is bound to authenticated session tokens.

### [0:45 – 1:15] Scene 3: Gate 1 & Ephemeral In-Memory Vault

**ON SCREEN:** Select HC-014 preset. Click "Run Gate 1 & 2". Show [CONDITION_1] masked. Click "In-Memory Vault" tab to show RAM memory addresses and zero disk retention.

**VOICEOVER:** *"Here is a hospital note with patient Rahul Mehta, diagnosed with HIV, living on MG Road. In Gate 1, fast detectors flag sensitive spans. Then, our JEV judge model analyzes each span in context. Code evaluates the policy table: for a billing clerk, patient name and MRN are allowed, but the HIV diagnosis and residential address are strictly masked. Look at the In-Memory Vault: raw secrets are quarantined in volatile RAM and replaced with safe tokens before transmission. The main AI model only ever sees [CONDITION_1] and [ADDRESS_1]."*

**KEY TAKEAWAY:** The primary AI model only receives token handles. Original secrets live strictly in volatile RAM.

### [1:15 – 1:35] Scene 4: The Demo Moment (Context, Not Keywords)

**ON SCREEN:** Switch back to Two-Gate Pipeline. Leave text untouched. Switch Role dropdown from Billing Clerk to Doctor.

**VOICEOVER:** *"Now for the demo moment. Watch what happens when I switch the role dropdown to Doctor on the exact same clinical note. Instantly, the HIV diagnosis flips from MASK to ALLOW. Why? Because the treating doctor requires clinical history for rounds. The words did not change at all—only the context changed."*

**KEY TAKEAWAY:** Identical words yield completely different, appropriate actions based on authenticated context.

### [1:35 – 1:55] Scene 5: Gate 2 Output Inspection & Paraphrase Catch

**ON SCREEN:** Switch role back to Billing Clerk. Click "Test Paraphrase Leak". Point to amber alert and auto-redacted output.

**VOICEOVER:** *"Leaks also happen on the way out. What if the model tries to evade filters by using subtle paraphrases like the patients immune condition? Gate 2 runs a two-step check: Step A searches for vault values in code; Step B uses JEV to catch semantic paraphrases and inferences. As you can see, Gate 2 caught the phrase and auto-redacted it before delivery."*

**KEY TAKEAWAY:** Gate 2 catches output paraphrases and indirect side-channel disclosures.

### [1:55 – 2:00] Scene 6: Zero-Leak Audit Log & Wrap-Up

**ON SCREEN:** Click "Audit Log" tab. Show clean JSON record with masked tokens and per-stage latencies.

**VOICEOVER:** *"Finally, our Audit Log records every decision with masked tokens and latencies, because storing raw secrets in logs creates a new leak. JEV: deterministic, context-aware privacy that protects sensitive data end-to-end."*

**KEY TAKEAWAY:** Compliance logs never record raw secrets.
